Managing Digital Resources, or, How Do You Hold Electrons In Your Hand?

by Anna L. Creech (Serials & Electronic Resources Librarian, Central Washington University) <creecha@cwu.edu>

Over the past few decades, electronic resources have impacted library workflows, staffing, and budgets. Now that most libraries have gotten past the catalog automation phase, our attention has been drawn to the evolutionary transition of print to electronic publication. Computers with CD-ROMs and online databases have replaced reference rooms plagued by multi-volume indexes taking up vast numbers of shelves. Instead of worrying about sagging bookcases and annual accumulations, we spend our time scrutinizing license agreements and troubleshooting proxy server bugs.

While most of us were happy to shed print indexes in favor of databases, there has been more hesitancy with journals and newspapers. The issues of access versus ownership heighten when dealing with content rather than indexes and abstracts. Serial collections are a long-term investment, and the online editions of journals are still in relative infancy. Again, this is a situation where the early adopters are singing the praises while the rest of the library world waits for the other shoe to drop. We have taken a leap of faith by adding online formats to our collections, but unlike the dusty tomes that still reside in our stacks, no one knows what will happen to them in ten or fifty years. Consortial relationships and Big Deal packages have encouraged many of the more hesitant libraries to acquire online journal packages, and once our users got hooked on instant online access to content, there is no going back to the days of lines at the photocopier. Full text has become the answer to the procrastinator’s prayer.

How do you hold electrons in your hand?

Managing electronic resources has brought about some commercial solutions such as journal A-Z lists, OpenURL, and ERM, but the question that plagues most librarians is staffing and workflow. The kind of technical knowledge needed to manage electronic resources is different from that needed to manage print resources. In most cases we have to do it with the same staff that has been faithfully processing our print journals for years. One person can manage a handful of online journals, but eventually this must be folded into the departmental workflow along with print.

While the functions of managing online journals are similar to print, the process is not. For example, online journals do not arrive via the mailroom. When a print issue is received, there is a system for updating holdings and getting it on the shelf to provide access for users. Similarly, when access to an online journal is activated, there is a process for providing access for users through links in the catalog or A-Z list or OpenURL link resolver. The end result is the same for both, but the way it is done is entirely different.

Professional literature in the field is scattered with articles and survey reports about workflow changes made at various libraries. Zhang and Haslam offer a brief description of the changes made at the University of Nevada-Reno in their 2005 article that presents options that may be available to larger university libraries. They had the benefit of flexible budgets and staffing. These benefits allowed them to drop tasks associated with print journals, train their staff on tools for managing electronic resources, and add staff positions in electronic resource management where needed.

In 2002, Duranceau and Hepfer surveyed libraries to find out how they organized staff activities involving the management of electronic resources. Their survey results indicated that although libraries have increased staffing for electronic resources, they have not done so in proportion to the number of electronic resources acquired. In fact, most libraries are understaffed in this area if one were to look at the statistics alone. Their survey found that electronic collections grew 1,100 percent in five years, but the staff time devoted to those collections grew only 614 percent. Like UNR, most of these libraries have managed the increases by distributing the work among existing staff and training them for the additional technical expertise.

Re-designing workflow is not for the faint of heart. It is easy to look at what needs to be done and how a department workflow should be organized, but it is not so easy when one factors in the personality and skills of existing staff. Staff limitations can result in workarounds that may impact how effectively electronic resources are delivered to users. While parallels can be drawn between print and electronic management, serials librarians must step outside of the box in order to fully address the needs of online journals.

For the most part, print serials are stable creatures that require only a minimal amount of care. On the other hand, their electronic counterparts constantly demand attention. We use a combination of link checkers, publisher notifications, and user feedback to alert us when there are connection problems. An array of spreadsheets, homegrown databases, and manila folders help us keep track of payments and licenses. Vendor-created ERM tools have cropped up in the past few years to replace and improve homegrown solutions, but they are expensive and geared towards large collections.

One workflow concern that gets brought up regularly is the process of receiving issues. Some serials departments have simply transferred the print check in process to the online world by regularly looking to see if new issues have been posted and updating their catalog records accordingly. This is a very intensive process with limited benefit to users. Either the journal issue is there or it is not. Many medium to large libraries have outsourced this aspect by making arrangements with a vendor to maintain links and update available dates as they receive that information from the publishers.

Another impact on workflow has been the merging of the serials librarian with the electronic resources or systems librarian. Traditionally, the serials librarian was concerned with print only and the electronic resource or systems librarian was concerned with electronic only. This delineation was simpler when a resource came in only one format, but it became less clear when publishers started providing free online access with print. Suddenly the serials librarian had to communicate with the electronic resources librarian about which journals have online access or not, and the lines between respective departments has become a blur. In many libraries, elements of both jobs were merged together into one serials and electronic resources librarian who coordinates the acquisition, administration, and evaluation of serial publications, regardless of format. Each library continued on page 34

may have a different title for this person, but one glance at a job postings list will verify that there is a demand for librarians in this area.

Electronic resources have infiltrated and taken over almost every aspect of library service, from the catalog to indexes to books and journals. Recent library science graduates have, in general, more experience with electronic resources than their predecessors simply because they were required to use them in their studies. It is possible that in the future, there will be less of a need for an electronic resource specialist. Aspects of electronic resource management now covered by the electronic resource librarian may eventually be returned to other areas of the library based once again on function rather than form. If workflows for print resources can be merged with workflows for electronic resources, eventually there may be no need to distinguish between the two.

Emery suggests that we need a more holistic view of electronic resources, because the processes of acquisition, access provision, administration, service provision, and evaluation are interrelated and cyclical. Print serials have similar connectedness, but it is not cyclical in the same way that online serials are. Long before computers and the advent of the Internet, serials librarians managed their collections regardless of the form they came in. This is still true for electronic journals, but unlike the many varieties of micro formats and print mediums, electronic formats are more ephemeral and require a different skill set to manage. The responsibilities of serialists have changed over time to reflect the change in mediums and delivery modes. They will continue to change in the future as technology provides new mediums for information dissemination.
